

# What are “URLs”?

**URL Config / Routes:** URL-Action mappings which ensure that certain results are “achieved” when certain URLs are entered by the user

# What are “Views”?

The logic that is executed for different URLs (*and Http methods*)

Function

Class

Code that handles (evaluates) requests and returns responses

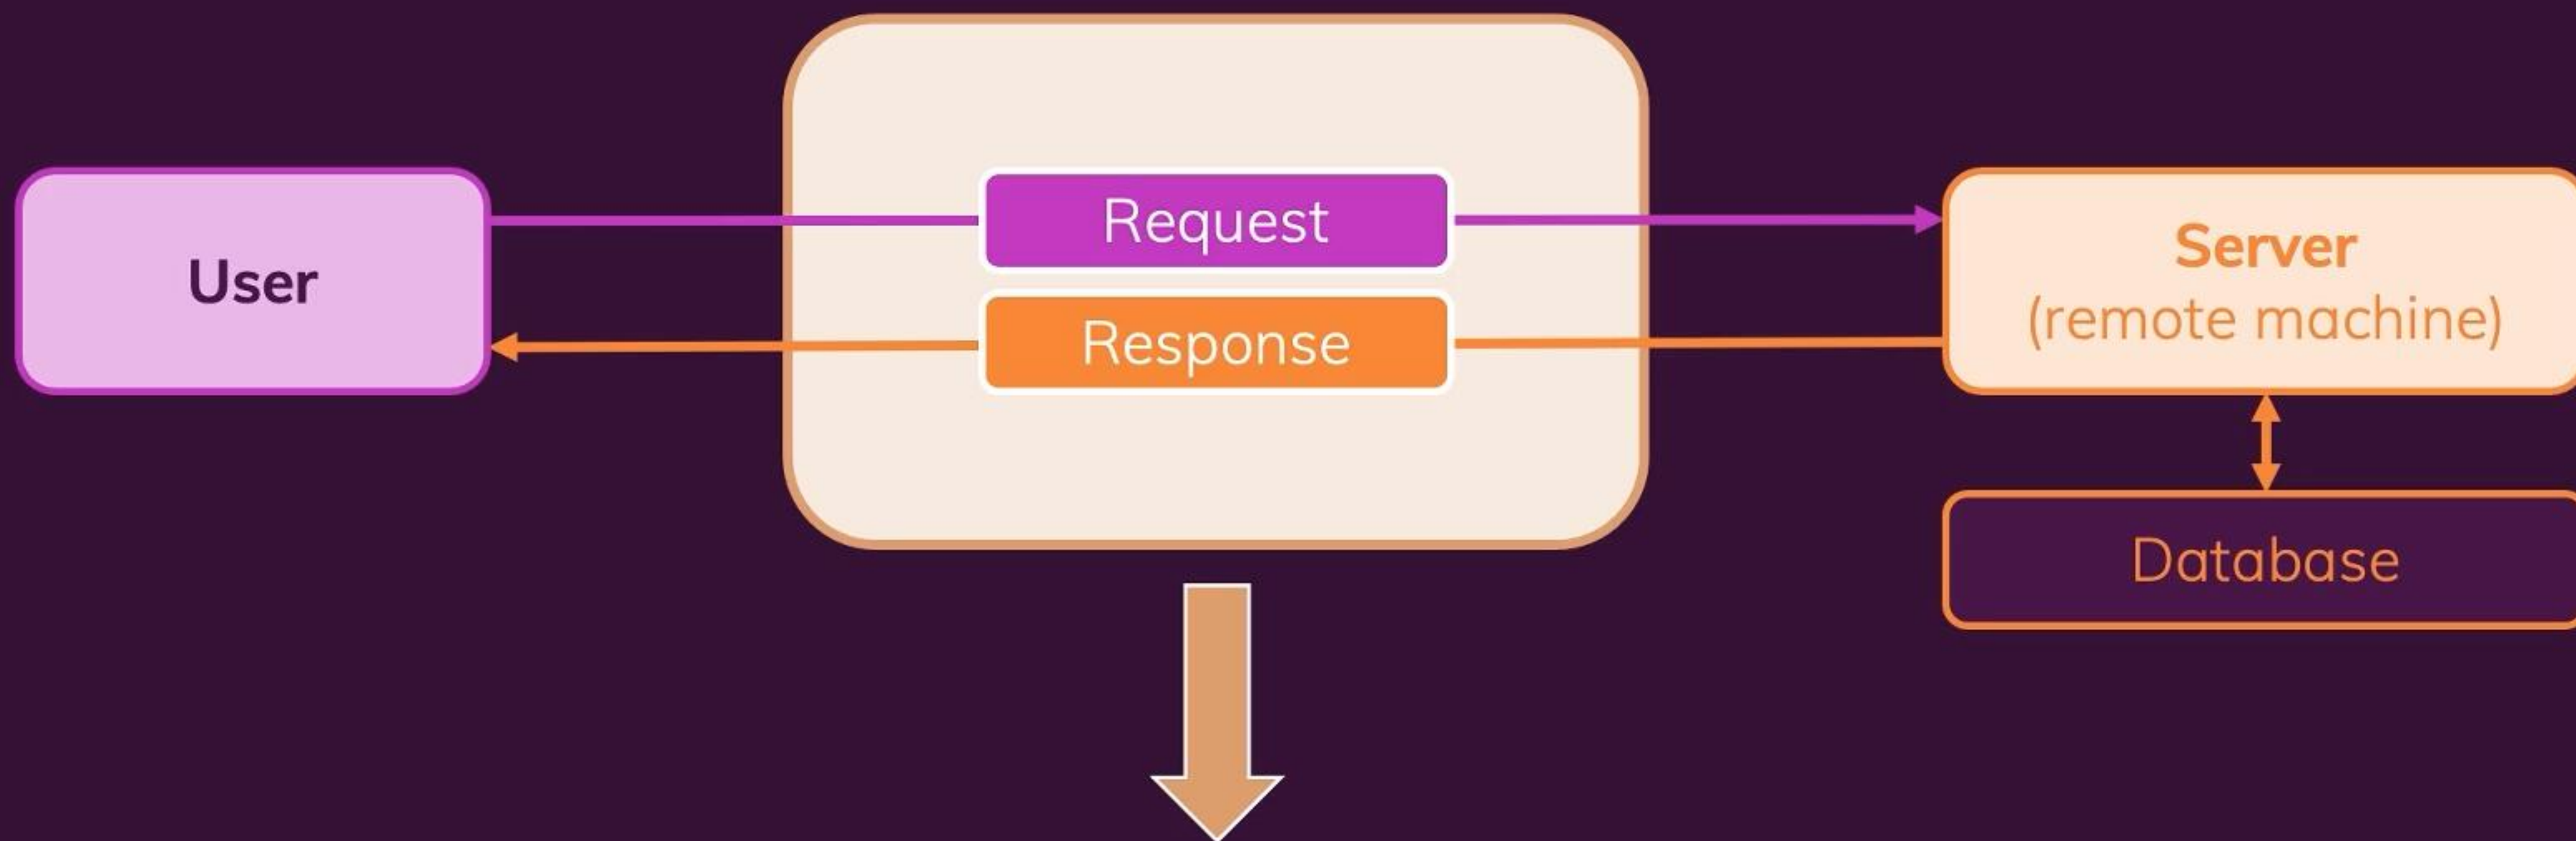

Load & prepare  
data

Run any other  
business logic

Prepare and return  
response data (e.g.  
HTML)

# URLs & Views

Views are responsible for **processing requests** (parsing the URL, Http method and potential request data) and **creating a response**

# Request / Response Flow
